

1) Open Elastic Benstalk

2) Add Details

The screenshot shows the 'Name, review, and create' step in the AWS IAM console. The 'Role name' field is filled with 'nishal'. The 'Description' field contains 'Allows EC2 instances to call AWS services on your behalf.' Below this, the 'Step 1: Select trusted entities' section shows a 'Trust policy' with a JSON snippet:

```
1 {
2   "Version": "2012-10-17",
3   "Statement": [
4     {
5       "Effect": "Allow",
6       "Action": [
7         "sts:AssumeRole"
8       ],
9       "Principal": {
10        "Service": [
11          "ec2.amazonaws.com"
12        ]
13      }
14    ]
15  }
```

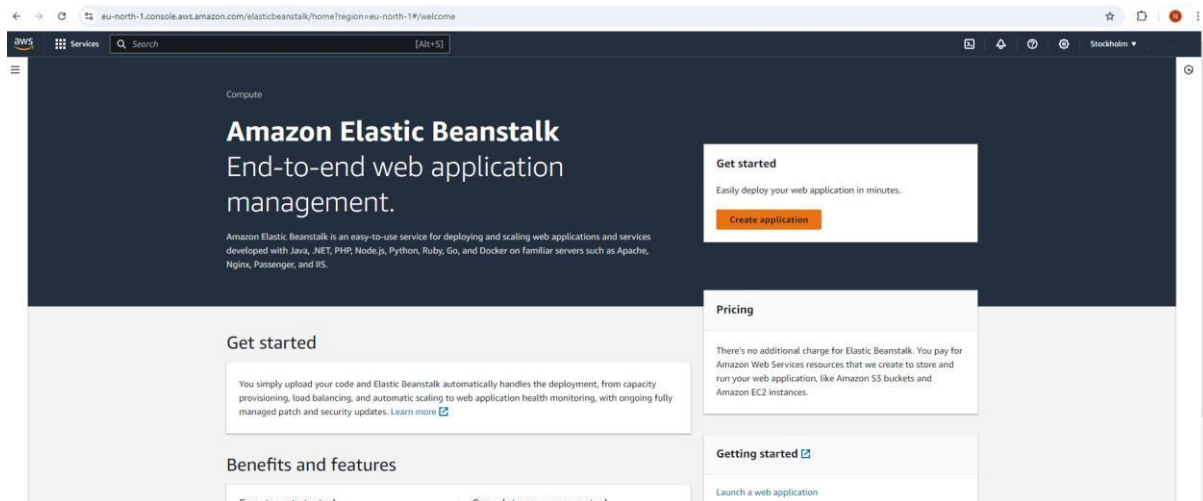

The screenshot shows the AWS IAM console after the role 'nishal' has been created. A green notification bar at the top says 'Role nishal created.' Below this, the 'Roles (3)' section lists the following roles:

Role name	Trusted entities	Last activity
AWSServiceRoleForSupport	AWS Service: support (Service-Linker)	-
AWSServiceRoleForTrustedAdvisor	AWS Service: trustedadvisor (Service-Linker)	-
nishal	AWS Service: ec2	-

Below the table, the 'Roles Anywhere' section is visible, with a 'Manage' button. The left sidebar shows the 'Identity and Access Management (IAM)' navigation menu.

3) Comeback to the Elastic Beanstalk

The screenshot shows the AWS IAM console with search results for 'elasticbeanstalk'. The search results are displayed in a sidebar on the left, listing services like Elastic Beanstalk, Elastic Transcoder, Elastic Container Service, and Elastic Container Registry. The main content area shows the 'Temporary credentials' section, which includes a 'Manage' button and a description of temporary credentials.

Step 1

Configure environment

Step 2

Configure service access

Step 3 - optional

Set up networking, database, and tags

Step 4 - optional

Configure instance traffic and scaling

Step 5 - optional

Configure updates, monitoring, and logging

Step 6

Review

Configure environment Info

Environment tier Info

Amazon Elastic Beanstalk has two types of environment tiers to support different types of web applications.

☒ Web server environment

Run a website, web application, or web API that serves HTTP requests. [Learn more](#)

☐ Worker environment

Run a worker application that processes long-running workloads on demand or performs tasks on a schedule. [Learn more](#)

Application information Info

Application name

WebApp

Maximum length of 100 characters.

► Application tags (optional)

Environment information Info

Choose the name, subdomain and description for your environment. These cannot be changed later.

Environment name

WebApp-env

Must be from 4 to 40 characters in length. The name can contain only letters, numbers, and hyphens. It can't start or end with a hyphen. This name must be unique within a region in your account.

Virtual Private Cloud (VPC)

VPC
Launch your environment in a custom VPC instead of the default VPC. You can create a VPC and subnets in the VPC management console. [Learn more](#)

vpc-0624ba2dbc4a5a551 [(172.31.0.0/16)]

[Create custom VPC](#)

Instance settings

Choose a subnet in each AZ for the instances that run your application. To avoid exposing your instances to the Internet, run your instances in private subnets and load balancer in public subnets. To run your load balancer and instances in the same public subnets, assign public IP addresses to the instances. [Learn more](#)

Public IP address
Assign a public IP address to the Amazon EC2 instances in your environment.
☐ Activated

Instance subnets
